Do you have lupus?
This research study may be for you.

If you have lupus, you are at ten times the normal risk of having a heart attack. And heart problems may occur up to decades earlier for you than for someone without lupus.

Penn State Milton S. Hershey Medical Center researchers are trying to identify what may make some lupus patients more likely to have heart disease. Participation includes blood work and cholesterol checks, as well as studies of the heart. We’re also looking for healthy volunteers, ages 37 to 75. Compensation is provided for participation.
